## Aim:

Write a Java program that implements an interface.

Create an interface called Car with two abstract methods String getName() and int getMaxSpeed() | Also declare one default method | void applyBreak() | which has the code snippet

```
System.out.println("Applying break on " + getName());
```

In the same interface include a **static** method Car getFastestCar(Car car1, Car car2), which returns car1 if the maxSpeed of car1 is greater than or equal to that of car2, else should return car2.

Create a class called BMW which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Similarly, create a class called Audi which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Create a **public** class called MainApp with the **main()** method.

Take the input from the command line arguments. Create objects for the classes BMW and Audi then print the fastest car.

## Note:

Java 8 introduced a new feature called default methods or defender methods, which allow developers to add new methods to the interfaces without breaking the existing implementation of these interface. These default methods can also be overridden in the implementing classes or made abstract in the extending interfaces. If they are not overridden, their implementation will be shared by all the implementing classes or sub interfaces.

Below is the syntax for declaring a default method in an interface:

```
public default void methodName() {
    System.out.println("This is a default method in interface");
}
```

Similarly, Java 8 also introduced static methods inside interfaces, which act as regular static methods in classes. These allow developers group the utility functions along with the interfaces instead of defining them in a separate helper class.

Below is the syntax for declaring a static method in an **interface**:

```
public static void methodName() {
    System.out.println("This is a static method in interface");
}
```

**Note:** Please don't change the package name.

## Source Code:

2022-2026-CSE-B

```
package q11284;
interface Car {
   String getName();
   int getMaxSpeed();
   default void applyBreak() {
      System.out.println("Applying break on " + getName());
   static Car getFastestCar(Car car1, Car car2) {
      return (car1.getMaxSpeed() >= car2.getMaxSpeed()) ? car1 : car2;
}
class BMW implements Car {
   private String name;
   private int maxSpeed;
   public BMW(String name, int maxSpeed){
      this.name = name;
      this.maxSpeed = maxSpeed;
   public int getMaxSpeed() {
      return maxSpeed;
   public String getName() {
      return name;
   }
}
class Audi implements Car {
   private String name;
   private int maxSpeed;
   public Audi(String name, int maxSpeed) {
      this.name = name;
      this.maxSpeed = maxSpeed;
   public int getMaxSpeed() {
      return maxSpeed;
   public String getName() {
      return name;
   }
public class MainApp {
   public static void main(String args[]) {
      String name = args[0];
      int speed = Integer.parseInt(args[1]);
      String name1 = args[2];
      int speed1 = Integer.parseInt(args[3]);
      Car car1 = new BMW(name, speed);
      Car car2 = new Audi(name1, speed1);
      System.out.println("Fastest car is : " + Car.getFastestCar(car1, car2).g
etName());
   }
}
```

## Execution Results - All test cases have succeeded!

Test Case - 1	
User Output	
Fastest car is : BMW	

Test Case - 2
User Output
Fastest car is : Maruthi
